THE SMART GUN

GUN CORNER

The invention and the achievement of the Gun Corner was born in 1996. Concerned about the quality of the irrigation by reel machine, Mr DI PALMA created the Gun Corner which allows to water following straight lines and not in half circle. This system patented uses the principle of a jet breeze "clever" to divide the water homogeneously in the fields.

Today with 20 years of experience, with many modifications and nearly 6000 devices in operation, Di Palma irrigation offers advice and services to accompany you on your water saving projects and yield gains thanks to Gun Corner.

The jet breeze of the Gun Corner fits all guns and respond to the double problem's of watering at the edge of the parcel, on the plans of the overflow and the homogeneity of the contributions.

It makes it possible to bring the starting positions of the Gun Corner to 15 meters from the edge of the plot avoiding splashing water outside of this one.

By adjusting the start delay, we bring the desired dose. At the arrival, the device, also playing on the delay, avoids the use of sprinklers of the coil.

This technology is based on a sensor, placed on the wheel of the trolley which locates the positions of the barrel in the parcel and activates if necessary a device jet located near the barrel.

No program is necessary, the Gun Corner is a device at the front of the irrigation. Thanks to its jet breeze adaptable to all types of guns, the Gun Corner allows to modify the surface watered by the barrel. This avoids wasting water, the yield loss on the edges, excess water and also helps to avoid watering the neighborhood and the roads.
